PTM: ACYLATED, PHOSPHORYLATED ON SERINE AND N-GLYCOSYLATED WITH
TWO TYPES OF OLIGOSACCHARIDE CHAINS.

MISCELLANEOUS: THE EXPRESSION OF THIS STRINGENTLY REGULATED
PROTEIN DURING CELL DEVELOPMENT IS MEDIATED THROUGH CELL-SURFACE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          O J. 8:371-377(1989).

FUNCTION: THIS CELL-SURFACE GLYCOPROTEIN MEDIATES CELL-CELL BINDING VIA HOMOPHILIC INTERACTION.

SUBCELLULAR LOCATION: ATTACHED TO THE MEMBRANE BY A GPI-ANCHO THAT CONTAINS A PHOSPHOCERAMIDE MOIETY, SUCH ANCHOR MEDIATES FAST AND LONG PERSISTENCE CELL ADHESION OF THE PROTEIN.

DEVELOPMENTAL STAGE: RESTRICTED TO THE AGGREGATION STAGE OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CAMP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ..

                                                                                                                                                                                                                             This sequence represents a human TRID (TRAIL (TNF-related apoptosis-inducing ligand) receptor without an intracellular domain). PRID is a member of the tumour necrosis factor receptor (TNFR) family also known as TNFR-5. TRID is expressed in haematopoietic tissues and other normal human tissues. For a number of immune system-related disorders, substantially altered (whether increased or decreased) levels of TRID gene expression can be detected, therefore the TRID polypeptides, nucleic acids and antibodies are useful in the diagnosis of such immune system related disorders. Mutations of the TRID gene can also be detected. TRID can also be used to identify ligands which may be useful in the treatment of apoptosis related disorders. TRID is administered to humans at a parenteral dose of 0.01 to 1 mg/kg/day.
                                                                                                                                                                                                                                                                                                                                                                                   Human

tumour necrosis factor receptor family that binds to Apo-2 ligand. Its amino acid sequence was deduced from the nucleotide sequence of an isolated cDNA clone (see AAV84347); an alternative translation initiation site in this clone will encode a polypeptide (see AAW88409); comprising amino acid residues -40 to 269 of Apo-2DcR. Apo-2DcR shows more semmence identity to now in the contraction of the contraction o

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  than to other apoptosis-linked receptors. The polypeptide can be obtained by expression in host cells using the vector deposited as ATCC 209087. The invention provides vectors and host cells for recombinant production of Apo-2DcR polypeptides, antibodies, and transgenic and knockout animals (useful e.g. for screening and developing drugs that protect against excessive apoptosis).

Apo-2DcR, or chimeras comprising Apo-2DcR or its (claimed) extracellular domain fused to a heterologous polypeptide are used to modulate apoptosis of mammalian cells (claimed) and/or NF-KappaB activation by Apo-2 ligand, and may be expressed in vivo or ex vivo for gene therapy. They can be used in methods for the modulation and diagnosis of apoptosis e.g. in cases of neurodegeneration.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 autoimmune diseases and inflammation. Most human tumour cells do not express Apo-2DcR transcripts, but normal tissues do, suggesting that Apo-2DcR may permit selective killing of cancer cells by Apo-2 ligand, possibly by protecting normal, but not cancerous, cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human PRO366
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

                                                                                                                                                                                                                                                                  polypeptide expression in a cell sample to that in a control sample. Some of the 275 sequences are also useful to stimulate the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, the proliferation or differentiation of chondrocytes, the proliferation or gene expression in pericyte cells, the release of proteoglycans from cartilage, the proliferation of inner ear utricular supporting cells or of T-lymphocytes, the release of a cytokine from peripheral blood monocytes (PBMCs), or the proliferation of endothelial cells. Some of the PRO polypeptides may modulate glucose or free fatty acid uptake by skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide to factor VIIA. The PRO polypeptides can be used in assays to identify molecules involved in binding interactions. The polynucleotides encoding PRO polypeptides can be used to generate probes, antisense RNA/DNA, transgenic or knock out animals and can be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             22-MAY-2000;

Apo-2DcR shows homology to apoptosis-linked receptors of the tumour necrosis factor receptor family, such as DR4 and Apo-2. The invention provides polynucleotides (see AAF30050-62) encoding novel human PR0 proteins (see AAB20108-20) including PR0366. Claimed compositions

parasite, bacteria and viruses, restenosis and graft versus host disease. They are also useful for inducing proliferation of T-cells, endothelial cells and certain haematopoietic cells, to regulate antiviral responses and to prevent certain autoimmune diseases after stimulation of TRID by an agonist or TRAIL binding facilitator. The antibodies which bind TRID polypeptides are useful for treating and/or preventing diseases associated with increased or decreased apoptotic cell death. The TRID polynucleotides, proteins, antibodies, agonists and antagonists are useful in the diagnosis, treatment or prevention of: (a) cancer; the intermed of the processed apoptotic cell death.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             activities; and can be used in gene therapy. The TRID polynucleotides are useful for detecting complementary polynucleotides. TRID proteins and polynucleotides are useful in the treatment of tumours, resistance to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents the human TRID protein (tumour necrosis factor (TNF) related apoptosis inducing ligand (TRAIL) receptor without intracellular domain, also referred to as tumour necrosis factor receptor 5 (TNFR 5 or TR5). TRID has cytostatic, immunosuppressive, nootropic, neuroprotective, antiviral, antiinflammatory, anticonvulsant, antiparasitic, cardiant, anti-HIV, antiparkinsonian and vasotropic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid encoding a TRID polypeptide, also referred to as necrosis factor receptor 5, useful in the diagnosis, treatment prevention of cancer, autoimmune disorders and viral infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    immunosuppressive; neuroprotective; antiviral; antiinflammatory; anticonvulsant; antiparasitic; cardiant; anti-HIV; antiparkinsonian; gene therapy; restenosis; graft versus host disease; tumour; cancer; apoptotic cell death related disease; autoimmune disorder;

RESULT AABSJULT AABSJ
The invention relates to novel human angiogenesis-associated proteins designated PRO proteins (AAB53064-B53097), and to nucleic acids encoding PRO proteins. The invention also relates to vectors and host cells comprising a PRO nucleic acid, the recombinant production of a PRO protein, PRO antibodies specific for a PRO protein, fusion proteins comprising a PRO protein, agonists or antagonists of a PRO protein, and compounds which inhibit the expression of a PRO gene. The invention additionally encompasses methods of identifying modulators of PRO expression or activity; diagnosing a cardiovascular, endothelial or angiogenic disorder, or a susceptibility to such a disorder by detecting mutations in a PRO gene, or the expression level of a PRO gene within a particular tissue; treating a cardiovascular, endothelial or angiogenic disorder via the administration of a PRO protein.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cardiovascular, endothelial or angiogenic disorders, such as atherosclerosis, osteoporosis, myocardial infarction, hypertension, diabetic retinopathy, rheumatoid arthritis, Crohn's disease, psoriasis, endometriosis, ulcers, wounds, cancer, Alzheimer's disease, Huntligton's disease, or stroke. PRO nucleic acids are additionally useful in the recombinant production of PRO proteins, as hybridisation probes to screen libraries to isolate cDNAs with sequence identity to PRO proteins, to map genes encoding PRO proteins, to analyse genetic disorders, and in gene therapy. PRO nucleic acids can also be used to produce transgenic animals useful for the development and screening of potential therapputic agents. The present sequence represents a PRO protein of the
                                                                                                                                                                                                                                                  FLAG-epitope tag; transmembrane domain; death domain; apoptosis; cell suicide; tissue homeostasis; cell proliferation; cell-cell signalling; Trail Receptor without Intracellular Domain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PRO agonist or antagonist; a retroviral gene therapy vector comprising a PRO nucleic acid; and methods of inhibiting or stimulating endothelial cell growth, cardiac hypertrophy or PRO-induced angiogenesis via the administration of a PRO protein, or an agonist or antagonist thereof. PRO nucleic acids, PRO proteins, antibodies against PRO proteins, PRO agonists and PRO antagonists may be used as therapeutic agents to treat
                                                                                                                                                                                                                                                                                                                FLAG-TRID
